

Sample Data Folder

Input File Archetype

As a premium subscription user, I want to upload a batch of CSV files containing up to 10,000 transaction records so that I can automatically process my monthly financial analytics report.

Expected Outputs Generated

The application backend splits processing targets across three core schema keys packaged into a unified, structured JSON transmission object.

Tab 1 Object Payload (Test Cases Output Array)

Functional Flows: Premium user uploads a valid CSV file with exactly 5,000 records. Verify successful processing and compilation of the monthly financial analytics report.

Exception Flows: Non-premium user attempts to upload a batch CSV file. Verify that the system blocks the action and displays an authorization upgrade notification.

Edge Conditions: Premium user uploads a CSV file containing exactly 10,001 transaction records. Verify that the application limits the processing flow and flags a data threshold constraint warning.

Tab 2 Object Payload (Acceptance Criteria Output Array)

Criterion 1: The file intake mechanism must exclusively accept authentic .csv file types and reject alternative file formats.

Criterion 2: Processing execution for batches within the 10,000-record threshold must finish and display data visualization within a maximum timeout of 20 seconds.

Tab 3 Object Payload (Gherkin Specification Structure)

Feature: Monthly Financial Analytics Processing Engine

Scenario: Successful batch transaction upload by a premium tier user

Given the user is authenticated with a premium subscription account status

When the user uploads a batch transaction file with valid CSV formatting

Then the data processor parses the financial parameters and builds the report
